Research Interest

I'm interested in statistics, machine learning, and convex optimization. Broadly, I am interested in understanding the mathematics and its application in data science.

Education

Rutgers University
MS., [all but M.S. thesis] Statistics
(Incomplete M.S. in statistics, with additional work in mathematical statistics, probability, Bayesian statistics courses. M.S. research topic focused on Bayesian statistics. I compared 11 resampling algorithms with Boltzmann distributions: metropolis, equi-energy sampling, parallel tempering, Hamiltonian, and etc.)

University of California, Davis
B.S. in Statistics, May 2010
Minor: Economics

Skills

Software: R, Python, Matlab, Stata, C, C++, Java

Data Science: Extensive training in high-dimensional statistics, and statistical learning theory. Fluent in building statistical models and data visualization in R and Python including packages caret, glmnet, scikit-learn, NumPy, Pandas, ggplot2, and Plotly. Also, deep learning experience with PyTorch and TensorFlow for convolutional neural network.

Languages: English, Chinese, French (conversational)

Working paper and contributions

Colin Cui. On Statistical Learning Theory, Oracle inequality, and the Lasso. Dec. 2020
(available: https://cui-colin.github.io/main_arxiv.pdf)
In this working paper, I highlighted theorems and proofs of high-dimensional statistical learning theory in the past decade. It provided an overview of theory and proof in simple terms to the general audience who may not be familiar to statistics. It also surveys concentration inequalities (which are needed for the proofs), oracle inequality, penalized regressions, and the convergence rate of Lasso.

Xiaodong Zhao, et. Al. A Bayesian approach for characterization of soft tissue viscoelasticity in acoustic radiation force imaging. *International Journal for Numerical Methods in Biomedical Engineering,* 32(4):e02741, 2016 (contributed)
In biomedical imaging, acoustic radiation force (ARF) were developed for

characterization of the viscoelasticity of soft tissue, which leads to stress distribution of a region of excitation (ROE). To improve estimation of the ROE, we presented a Bayesian inverse formulation. The Bayesian approach formulates the known parameter as a distribution. To make the Bayesian approach computationally feasible, Gaussian Processes was used as a metamodel to approximate the complex finite element model. Our study showed that Bayesian approach to FE improved even in the presence of large uncertainty.

Avram Goldberg, et al. *Clinical Outcomes of Scleroderma Patients At High Risk for Pulmonary Hypertension. Analysis of the Pulmonary Hypertension Assessment and Recognition of Outcomes in Scleroderma Registry*. ACR/ARHP Annual Meeting, 2012. (acknowledged)

In this paper, I worked on data visualization with ggplot2 on pulmonary hypertension disease data from Georgetown Medical School. I performed parametric tests, identified variables that contribute to pulmonary hypertension disease and a patient's survival rate.

Experience

Data Scientist, Ideal (co-founder)**,** Feb. 2018 - Present

- Built statistical machine learning models for NYC start-ups and small businesses
- Served over 50 small firms and individuals in, achieved first year profit
- Past client partners include NYC professor startup on algorithmic trading in Manhattan

Research Scholar for Prof. Assimina Pelegri, MAE, Rutgers University**,** July 2014 – Jan 2018

- Area of focus: We presented a Bayesian formulation to estimate the stress distribution of region of excitation (ROE) in biomedical imaging. The Bayesian approach formulates the known finite element (FE) model parameter as a probability distribution. To make it computationally feasible, Gaussian Processes was applied as a statistical estimation to solve inverse problem. Our simulation study showed that Bayesian approach to FE improved even in the presence of large uncertainty.
- Selected Project: "A Bayesian approach for characterization of soft tissue viscoelasticity in acoustic radiation force imaging" Xiaodong Zhao, Assimina Pelegri
  Oral Presentation: SIAM Conference (MS10) at Philadelphia, PA (March 2016)

Adjunct Faculty, New Jersey Institute of Technology Sept. 2013 – Feb. 2014

- Taught Math 105 Elementary Statistics and Probability
- Duties include: teaching first year statistics course, grading, reviewing student progress

Research Assistant, Department of Statistics, Rutgers University**,** Jan. 2013 – Jun. 2013

- Advisor: Professor Zhiqiang Tan
- Area of focus: Compared 11 resampling algorithms for Boltzmann distributions including independent metropolis, equi-energy sampling, parallel tempering, and simulated tempering
- Simulated Monte Carlo methods for numerical approximation using statistical software R**.** Performed stochastic approximation to MCMC algorithm with empirical results in order to prepare manuscript for publication.
- Selected Project: "Resampling Markov chain Monte Carlo algorithms: Basic analysis and empirical comparisons" Zhiqiang Tan (paper)

Research Intern for Dr. Gail Gong (Stanford University) Jun. – Jul. 2010

- Researched in a cohort of four students on estimation in human genetics and disease

- Stimulated family data using R language and compare different ways of estimating the penetrance of disease
- co-generated cancer data, and identified bad alleles and find its probability

Conference

Bayesian Inference Using Gaussian Process Metamodel in Biomedical Imaging (*with* A. Pelegri, and X. Zhao). *Conf. Mathematical Aspect of Material Science,* 2016
